OBJECTIVE

Make the world a better place. My aim is to work on projects/solutions/products which directly benefit people. I receive great satisfaction from solving practical tasks where the solution is somehow observable. Automating tasks and making my life easier with the help of technology - it is something I invest a part of my free time into.

WORK EXPERIENCE

Lindex - Gothenburg, Sweden
IT Integrations Specialist (2021 - current)

Benify - Gothenburg, Sweden (2019 - 2021)
Senior Integration Specialist (2020 - 2021)

- Making things communicate and work together
- Overseeing and implementing technical side of the new customer implementation projects
- Working in distributed, crossfunctional team

Applications consultant (2019 - 2020)

- Implementing solutions for production customers
- Making sure everything works - aka bug hunting
- Keeping the team together by baking fika

Jeppesen (Boeing) - Gothenburg, Sweden (2012 - 2019)
System Analyst (2015 - 2019)

- Software implementation of customers' requirements
- Modification of the standard systems to meet customers' business needs

Service Manager (2012 - 2015)

- Corporate customers (airlines) communication
- Quality assurance meetings - system improvements suggestions
- Debugging and patch development

University of Gothenburg, Sweden (2010-2012)
Developer (2011)

- iOS developer , focus on multimedia and image recognition libraries
- PHP , CSS website development for education fair

Supervisor (2010-2012)

- Supervision of the first and second year students
- Guiding in terms of group work and project development

SPSS BI Greece (Predicta) - Athens, Greece (2006 - 2009)
Technical Support, Web based applications support and development

- Corporate customers communication skills
- Technical writing : user-guides and troubleshoot instructions
- ASP.NET web applications support and development
- Hands-on experience in computer networks and hardware

EDUCATION

IT University of Gothenburg, Sweden (2009 - 2012)
Software Engineering and Management program

- Practical experience with programming languages Java , C , Erlang
- Experience in full scale software engineering projects - requirements specification, design, development, testing and quality assessment
- Implementation of SCRUM and other agile development practices
- Game development , distributed and embedded systems development
- Courses on: user interface, database design, software architecture, testing, quality assurance, software process improvement, change management

Technological Educational Institution of Athens, Greece (2006 - 2008)
Electrical Engineering in Energy Technology

- 2 years of education covering electrical engineering , electronics , mechanics , thermodynamics etc.

International High School of Athens, Greece (2003 - 2006)
High School degree

- Communication skills in multi-cultural environment

SKILLS

Languages

Swedish (advanced), English (advanced), Greek (advanced), Russian (mother tongue). Spanish (beginner)

Driver License:

Category A, B

Personal qualities

Curious, Resourceful, Zealous, Fun, Adaptable, Communicative

Other:

Scripting Integrations simple solutions JavaScript MySQL Programming Python SQL Team work Web Development Parenting survival Fika

PROJECTS

Personal projects that I do on my free time to scratch my itches or help people around me to be more efficient in what they do.

3 children 👨👩👧

born 2016, 2019, 2021 - leave me no free time to pursue personal projects but boy parenthood should be on CV!

Youtube to podcast 🐼 PHP

Project converts youtube videos to mp3 audio file, stores the file on my server and adds the link to this mp3 file to my RSS feed. I then listen to this audio file as podcast on my phone.

Word catcher 🐼 Python Fun

Quick implementation of a fun idea to help my friend learn English. The script will search a given word or phrase in the subtitles of a movie (present on the hard drive) and will cut out all the scenes where given word is spoken and compile new clip out of these scenes. The goal was to hear the pronunciation of the word and different use-cases for it.

Swedish Migration Office - case check PHP

It takes so long for migration office to take a decision on your work permit case that I get tired of checking the status, so this script is checking the status of my application 2 times a day by scraping the website and looking for the right patterns. Then it notifies me by email if the decision is taken.

Workout audio guide generator Python Amazon API Standalone script

Takes the list of HIIT exercises and generates audio file out of them: combines mp3 files of background music and merges that background with the exercise name read out by the voice of Amazon's Polly. As result you get an audio file which is follow along workout. Motivation: I could never remember 10 exercises and their order during high intensity workout, so I had to constantly look at the paper which kind of sucked.

Image manipulation projects 🐼 PHP JS Canvas

To help my wife save time for generating participation certificates in a workshop, this script takes the certificate's template and a list of the participants and generates one pdf document with participant's name on the certificate. This same script also generated name tags for participants which also had different colours based on the role of participant.

Herz freerider 🐼 PHP Scraping Website

Herz (car rent company) has a site "freerider" where one can book a car for free. This car should be driven from location A to location B directly. It was a great and free way to travel for us when we were students. The problem was the booking process and the popular destinations were gone quickly (like Got to Sto). The script scrapes the site looking for good destinations, allows to book directly with herz. It also shows the route and how long it will take to drive to destination

Memrise course Node.js Scraping Automation

Memrise is a platform which helps people to memorize things, like foreign words and many more. A friend of mine was planning to move to Sweden for work so I decided to help him with language. Memrise allows users to create courses and load different words there with translations. I created a course with 1000 most used words in Swedish language based on the Arbetsformedlingen website. I scanned all the job postings on the site and collected all the words and sorted them by usage. Then I used acapela-group website to generate mp3 file with pronunciation of the word and google translate to get the translation of the words. Fun!

Run Challenge 2017 🐼 PHP Laravel

In 2017 I join the running challenge where I had to run 2017 km during they year 2017. I created a laravel project (just to get to know it a bit) which took the data from strava.com about my current year activities, combined the distances I ran so far and gave me statistics how far behind the goal I am and how much I should run every day if I want to complete the challenge. Spoiler: I didn't run 2017km that year :/
